

ABSTRACT OF THE DISCLOSURE

A medical image radiographing system capable of radiographing a medical image at a patient's location efficiently and accurately. The medical image radiographing system has: a radiographing apparatus for radiographing a medical image of a patient; an information management apparatus for managing radiographing order information; a control apparatus for obtaining the radiographing order information from the information management apparatus through a communication network; and a portable terminal connectable to the control apparatus; wherein the control apparatus comprises a storage section for storing the radiographing order information and an assigning section for assigning an operator for performing radiography and transmitting the radiographing order information to the portable terminal, and the portable terminal comprises a storage section for storing the radiographing order information and the operator identification information, an authentication section for authenticating the operator and a display section for displaying the radiographing order information when the authentication section authenticates the operator.
